

EXCESS AIR BURNERS XNM SERIES

FEATURES

- Mixer: cast iron G25
- Plate: cast iron G25
- Air tube: AISI304
- Pre-heated air: up to 450°
- Suitable for different types of gas: CH₄/L.P./propane/etc
- Standard refractory block, max. temp.: 1750°C
- Capacity range: 16 to 1700 kW
- Excess air for all models: over 800%
- Excellent flame stability: excess air
excess fuel
on ratio firing
- Low NO_x level.
- Wall mounting flanges to fasten the block holder to the furnace shell are threaded to allow for positioning of accessories: pilot burner, flame detectors (electrodes or UV scanners), peepsight.
- Separated air and gas inlets, mixing at discharge point, no flashback.

F3502102

APPLICATIONS

- Annealing furnaces.
- Air heaters.
- Heat treat furnaces.
- Incinerators.
- Stress Relieving Furnaces.
- Brick furnaces.
- Ladle and crucible melting reheating.

F3502101

DESCRIPTION

Excess air burners are intermediate flame length, nozzle mixing types designed for 800% excess air. A unique design and stepped tunnel burner blocks produce excellent flame stability at all firing rates. Excess air systems use a constant air flow and "on ratio" combustion at high fire. Only the gas flow is reduced for fuel input turndown. The total volume of hot gases and velocity remains nearly constant at all firing rates. Furnace pressure, turbulence and heat

transfer rates are uniform. Excess air burners are variable temperature air heaters. At high fire flame temperatures may be about 1500°C or higher. As fuel only is decreased, exit gas temperatures drop to as low as 300°C with 800% excess air.

INSTALLATION

XNM burners are usually mounted on the wall. Other mounting positions are not recommended; specify if other mounting positions are absolutely necessary when ordering.

When they are used, the furnace refractory should be set to leave some room on all sides of the block. This space should be packed with flexible, refractory, ceramic fibre protected by 20 mm of

refractory concrete on all sides to allow for expansion of the walls (see technical note). Flexible connectors are recommended for air and gas connections at the burner to allow slight movement or misalignment of piping and are required when pre-heated air is involved. Air and gas connections are Pyronics' standard threaded, or welding flanged type. They may rotate by 90°.

IGNITION AND FLAME DETECTION

XNM burners must be ignited at low fire with a PBST blast pilot.

Pilot burner must be switched off after ignition of main burner thus flame detection must be done by counterclockwise UV Scanner. For low capacity burners direct spark ignition may be done through DSE

electrodes. In this case UV-2 ultraviolet scanners must be used.

Flame detection systems are required on all burners with furnace temperatures below 750°C.

Catalog No.	Pilot burner ignition		Accensione con elettrodo	
	Ignition	Detection	Ignition	Detection
10XNM	P64PBST	UV-2 / 6EN-150 *	DSE-1	UV-2
12XNM	P64PBST	UV-2 / 6EN-150 *	DSE-1	UV-2
16XNM	P64PBST	UV-2 / 6EN-150 *	DSE-1	UV-2
20XNM	P64PBST	UV-2 / 6EN-300 *	DSE-1	UV-2
24XNM	P64PBST	UV-2 / 6EN-300 *	DSE-1	UV-2
32XNM	P86PBST	UV-2 / 6EN-300 *	(not available)	(not available)
48XNM	P86PBST	UV-2 / 6EN-300 *	(not available)	(not available)

(*) In most cases, we suggest you to make flame detection through UV- scanner. In some particular cases, it is possible to use continue pilot burner with detection electrode.

CAPACITY TABLE

Catalog no.	Excess air operation			On ratio operation				
	Air flow	Gas flow		kW at various air and gas pressures (at burner) (mbar)				
	Nm ³ /h	Max Nm ³ /h	Min Nm ³ /h	1.1	3.3	11	17.6 (¹)	26.4 (²)
10 XNM	71	7.1	0.8	16	23	47	62	73
12 XNM	100	10	1	23	32	64	85	103
16 XNM	200	20	2.2	44	64	129	167	205
20 XNM	283	28.3	3	64	94	185	243	293
24 XNM	425	42.5	5	97	141	281	366	440
32 XNM	850	85	10	193	281	563	733	879
48 XNM	1700	170	19	387	563	1125	1465	1758

NOTE

- ¹ In the highlighted column there are nominal capacities that must be used for a correct sizing of the burner (air pressure: 17.6 mbar)
- ² Air pressure of burner 25 mbar and gas pressure 10 mbar to develop maximum ratings excess air or "on-ratio".

FLAME DIMENSIONS TABLE

Model	Flame lenght mm
10 XNM	220 ÷ 300
12 XNM	220 ÷ 500
16 XNM	270 ÷ 750
20 XNM	320 ÷ 1.000
24 XNM	620 ÷ 1.250
32 XNM	780 ÷ 1500
48 XNM	1220 ÷ 2000

NOTE:

Flame dimensions are approximate, referred to burners feeded with CH₄, working at stoichiometric ratio, in free air. Values are included in a range: minimum value is referred to burner working at nominal capacity (¹), higher value at maximum capacity (²).

The flame shortens by increasing excess of air (decreasing gas flow rate)
